

## Next.js 🤔

```
// app/article.tsx
// Environment: client
import { revalidatePath } from 'next/cache'

export default function Article() {
  async function onArticleDelete() {
    'use server'
    // Environment: server
    // 🤔 Mixed server and client code inside same file
    // 🤔 Magic passing of props
    await db.article.delete({ article_id })
    // 🤔 Complex cache handling
    revalidatePath('/articles')
  }

  return (
    <button onClick={onArticleDelete}>Delete</button>
  )
}
```

## Vike + Telefunc ✨

```
// article.telefunc.ts
// Environment: server
export async function onArticleDelete({ article_id }) {
  await db.article.delete({ article_id })
  return { success: true }
}
```

```
// article.tsx
// Environment: client
import { onArticleDelete } from './article.telefunc.ts'
export default function Article() {
  const onClick = async () => {
    const { success } = await onArticleDelete({ article_id })
    if (!success) alert("Deletion failed")
  }
  return <button onClick={onClick}>Delete</button>
}
```

✅ No caching by default (but you can if you want)
