

Build **fast**. Build **right**.

Composable framework for building advanced applications

Romuald Brillout

- Creator of Vike and Telefunc (tRPC alternative)
- Half French/German, grew up in Paris
- Computer Science at KIT (Karlsruhe, Germany)
- Lives in Munich

vite-plugin-ssr

Like Next.js/Nuxt but as do-one-thing-do-it-well Vite plugin.

- Started vite-plugin-ssr in 2021
 - Vite's early days (before its meteoric rise)
 - Idea: Powerful low-level hooks, for full control over integration
- Renamed to Vike
 - For "street cred"
 - Extensions: vike-react / vike-vue / vike-solid (and more)

```
// pages/hello/+Page.jsx
// Environment: client and/or server

export function Page(pageContext) {
  const confName = "c't <webdev>"
  return <>
    <h1>Hello {confName}</h1>
  </>
}
```

Conclusion
○

```
// pages/+onRenderHtml.js
// Environment: server

import ReactDOMServer from 'react-dom/server'

export function onRenderHtml(pageContext) {
  const { Page } = pageContext
  const pageHtml = ReactDOMServer.renderToString(<Page/>)
  return `
    <html>
      <body>
        <div id="root">${pageHtml}</div>
      </body>
    </html>`
}
```

```
// pages/+onRenderClient.js
// Environment: client

import ReactDOMClient from 'react-dom/client'

export function onRenderClient(pageContext) {
  const { Page } = pageContext
  ReactDOMClient.hydrateRoot(
    document.getElementById('root'),
    <Page/>
  )
}
```

```
// Doesn't depend on Node.js (e.g. can be used in Cloudflare Workers)
import { renderPage } from 'vike/server'

// Any server: Express.js, Cloudflare Worker, AWS Lambda Function, Fastify, Hono, Nitro, ...
server.addMiddleware({
  method: 'GET',
  route: '*', // catch-all
  async handler(request) {
    const pageContextInit = { urlOriginal: request.url }
    const pageContext = await renderPage(pageContextInit)
    // `body` is the HTML of the page with a route matching pageContextInit.urlOriginal
    const { body, statusCode, headers } = pageContext.httpResponse
    const response = { body, statusCode, headers }
    return response
  }
})
```

```
// pages/+onCreateGlobalContext.server.js
// Environment: server
export async onCreateGlobalContext() {
  const dataFromAPI = await fetchDataFromAPI()
  const someGlobalData = select(dataFromAPI)
  globalContext.someGlobalData = someGlobalData
}
```

```
// pages/+config.js
export default {
  passToClient: 'someGlobalData'
}
```

```
// Anywhere (client,server)
import { getGlobalContext } from 'vike'
const { someGlobalData } = await getGlobalContext()
```

- `+data.js`
 - Data fetching
- `+onCreateGlobalContext.client.js`
 - Client-side initialization (e.g. authentication)
 - Init store (e.g. Redux or Zustand)
- `+onCreatePageContext.{client,server}.js`
- `+guard.js`
 - Authorization
- `+onPageTransition{Start,End}.js`
 - Full control over page transition animation
- `+onBeforeRoute.js`
 - Full control over i18n integration
- ...

Extensions

- `vike-react`
- `vike-react-rsc` 🚧 ⇒ Server Components
- `vike-react-redux`
- `vike-react-zustand`
- `vike-react-query`
- `vike-react-apollo`
- ...

`vike-photon` ⇒ server & deployment

More: `vike-vue`, `vike-vue-pinia`, `vike-vue-query`, `vike-solid`, `vike-angular`, ...

Use case

Burda GmbH owns [focus.de](#), [chip.de](#), [bunte.de](#), ...

- **Before:** fragmented stacks
⇒ cannot improve all websites at once
- **Now:** Internal company framework powering all websites
⇒ Software Architects controls architecture of all websites
⇒ App code: product developers
- **Vike core**, without any Vike extension
⇒ full control over architecture + rock-solid foundation
- `vike-react` is ~1k LoC ⇒ easy to build your own framework

SPA/SSR/SSG

SPA, SSG, SSR, HTML streaming.

⇒ first-class support for all — also SPA

- `+ssr` **boolean** ⇒ toggle SSR/SPA on page-by-page basis
- `+prerender` **boolean** ⇒ disable/enable page-by-page
- SSG redirects
- 🚧 SSG dynamic routes (aka SPA fallback)
- `+data.client.js` ⇒ Data-fetching 100% client-side
- `react-streaming` ⇒ progressive rendering (aka partial hydration)
 - React library we created ⇒ fully Vike agnostic

Easily create SPA like the old days.

⇒ surprisingly hard with other frameworks (but shouldn't!)

Remote Functions. Instead of API.

- Optional: you case use REST/GraphQL instead.
- Simplicity.
- Inspired design of SvelteKit & Solid Start.

```
// CreateTodo.telefunc.ts
// Environment: server

// Telefunc makes onNewTodo() remotely callable
// from the browser.
export { onNewTodo }

import { getContext } from 'telefunc'

// Telefunction arguments are automatically validated
// at runtime, so `text` is guaranteed to be a string.
async function onNewTodo(text: string) {
  const { user } = getContext()

  // With an ORM
  await Todo.create({ text, authorId: user.id })

  // With SQL
  await sql(
    'INSERT INTO todo_items VALUES (:text, :authorId)',
    { text, authorId: user.id }
  )
}
```

Server

```
// CreateTodo.tsx
// Environment: client

// CreateTodo.telefunc.ts isn't actually loaded;
// Telefunc transforms it into a thin HTTP client.
import { onNewTodo } from './CreateTodo.telefunc.ts'

async function onClick(form) {
  const text = form.input.value
  // Behind the scenes, Telefunc makes an HTTP request
  // to the server.
  await onNewTodo(text)
}

function CreateTodo() {
  return (
    <form>
      <input input="text"></input>
      <button onClick={onClick}>Add To-Do</button>
    </form>
  )
}
```

Browser

React Router 🤔

```
// article/delete.ts
// Only a single action per file 😞
export async function action({ request }) {
  const { article_id } = await request.json()
  await db.article.delete({ article_id })
  return Response.json({ success: true })
}
```

```
// article.tsx
export default function Article() {
  const onClick = async () => {
    const res = await fetch("/article/delete", {
      method: "POST",
      headers: { "Content-Type": "application/json" },
      body: JSON.stringify({ article_id })
    })
    const { success } = await res.json()
    if (!success) alert("Deletion failed")
  }
  return <button onClick={onClick}>Delete</button>
}
```

Vike + Telefunc ✨

```
// article.telefunc.ts
export async function onArticleDelete({ article_id }) {
  await db.article.delete({ article_id })
  return { success: true }
}
```

```
// article.tsx
import { onArticleDelete } from './article.telefunc.ts'
export default function Article() {
  const onClick = async () => {
    const { success } = await onArticleDelete({ article_id })
    if (!success) alert("Deletion failed")
  }
  return <button onClick={onClick}>Delete</button>
}
```

Next.js 🤔

```
// app/article.tsx
// Environment: client
import { revalidatePath } from 'next/cache'

export default function Article() {
  async function onArticleDelete() {
    'use server'
    // Environment: server
    // 🤔 Mixed server and client code inside same file
    // 🤔 Magic passing of props
    await db.article.delete({ article_id })
    // 🤔 Complex cache handling
    revalidatePath('/articles')
  }

  return (
    <button onClick={onArticleDelete}>Delete</button>
  )
}
```

Vike + Telefunc ✨

```
// article.telefunc.ts
// Environment: server
export async function onArticleDelete({ article_id }) {
  await db.article.delete({ article_id })
  return { success: true }
}
```

```
// article.tsx
// Environment: client
import { onArticleDelete } from './article.telefunc.ts'
export default function Article() {
  const onClick = async () => {
    const { success } = await onArticleDelete({ article_id })
    if (!success) alert("Deletion failed")
  }
  return <button onClick={onClick}>Delete</button>
}
```

✅ No caching by default (but you can if you want)

RPC

- Not built-in by design (unlike Remix and Next.js)
- Any RPC tool: Telefunc, tRPC, ...
- Any non-RPC tool: React Query, GraphQL, ...
- Progressive migration from one paradigm to another
 - E.g. progressively migrate from GraphQL to RPC

npm

pnpm

yarn

bun

> npm create vite@latest --- --react --tailwindcss --daisyui --authjs --telefunc --hono --drizzle --eslint

Details

- Bugs quickly fixed (usually under 24h)
- Deployment skew protection
- Different Base URL for client/server
- `>=400` helpful warnings & error messages
 - Minimal in client-side production to save KBs
- Infinite loop guards
- CSP support
- ISR support (via `@photonjs/vercel`)
- Route Functions
- ...

Open Source Pricing

- 100% MIT licensed
- 100% free for engineers
 - No license needed — works like a normal open source tool
- Only larger companies pay
 - They see a pesky toaster in dev: Purchase a license at ...
 - Vike heuristic detects whether app is developed by a team
 - Pay only how much you can/want

It's not a bug, it's a feature.

Future

- Powerful extensions
 - Full-stack extensions, like Django / Ruby on Rails
 - Full-stack easy path
 - Eject ⇒ progressive & cherry-picked control

Our belief: Vike's architecture + powerful extensions is the future.

Why Vike

- ✓ Architecture (flexible core + powerful extensions)
- ✓ Next-gen DX
- ✓ Polished details
- ✓ Vibrant ecosystem
- ✓ Transparent business model

Vike Team

- Rom • Germany, Munich
- Joël • France, Belfort
- Dani • Hungary, Lake Balaton
- Muhammad • Indonesia, Aceh
